

Renfert extends the product range for digital workflows with the first CAD/CAM material.

EASY blank wax – the blank for state-of-the-art hybrid workflows

Many have the impression, that dental restorations are now all produced using full digital workflows. However, a day in a German dental laboratory paints a very different picture. Yes, the CAD/CAM technology is well established, however, conventional casting and pressing techniques are still being used regularly. For this reason, Renfert has extended its range of products for digital manufacturing with the EASY blank wax for the hybrid processing techniques CAD/Cast and CAD/Press.

The new EASY blank wax is available from February 2020. The blue blank is available in the usual diameter of 98.5 mm with a 10 mm groove and in sizes 14 and 20 mm in height. In the hybrid workflow, the restoration is first constructed efficiently using the CAD software and then milled from the EASY blank wax. The material – not, in fact, wax, but a modern acrylic material – can be processed flexibly in the usual manner. The coordinated material composition means that the material removed during milling forms small chips, which do not stick to the tool; this ensures a high degree of processing reliability. Standard strategies provide precise milling results that are characterized by very smooth surfaces and high edge stability. The homogeneous material burns-out completely residue-free, which means that the milled pattern can be used for casting techniques and for pressing full-ceramic restorations. The outstanding product characteristics of the EASY blank wax allow perfectly fitting restorations to be produced with an excellent surface quality.

Since 1925, the name Renfert stands for intelligent solutions and reliable service. The company slogan, “making work easy”, is already successfully implemented within the CAD/CAM market with high-performance suction units, special separating discs, polishing accessories, etc. Now, the EASY blank wax is available as the first material blank in the well-proven Renfert “made in Germany” quality.
